Green Guard® SC Premium

Biological Insecticide

Biological control of plague locust nymphs, wingless grasshoppers and other pest grasshoppers

- Biological control of plague locust nymphs, wingless grasshoppers and other pest grasshoppers
- An all in one oil suspension formulation for easy application with no mix partner required
- No withholding period for most agricultural cropping situations
- Has no effect on other insect species

Green Guard® SC Premium

Biological Insecticide

Green Guard® SC offers biological control of locusts and grasshoppers. Formulated with the naturally occurring fungus *Metarhizium*, Green Guard SC offers a pest control solution for environmentally sensitive areas. Infection occurs when locust and grasshoppers are in direct contact with spores during application or as they move through the treated vegetation.

Situation	Pest	Rate	Critical Comments
Agricultural areas Pastures Crops including Table and Wine Grapes. Forage crops and Non- crop areas	Nymphs of Australian plague locust (<i>Chorloicetes tenninifera</i>), Wingless grasshopper (<i>Phaulacridium vittatum</i>), and pest grasshoppers	500 mL in 75-225 L water per hectare	For best results apply when locusts and grasshoppers are at early nymph stage. Do NOT apply in gusty conditions greater than 8 metres per second or if rain is imminent in the next 6 hours.

Refer to the product label for full directions for use table.

Tips for maximising control

- Understand the lifecycle, movement and feeding habits of target pests
- Ensure all grasshoppers have hatched prior to treatment
- Use as a preventative control
- Minimise crop damage by applying to the nymph growth stage
- If infestation is dense, treat 10-15m band of vegetation in front of moving pests, followed by treatment of the pest band itself

Biological control with metarhizium infection[^]

Packaging

Available in 1L & 4L bottles

Spore viability and infection

- Infection occurs when pests are in direct contact with spores during application or as they move through treated vegetation
- Locust and grasshoppers are less mobile in earlier growth stages and can forage for longer periods in treated vegetation maximising spore infection
- The rate of spore infection is optimised at 25-35°C
- At temperatures above 33°C locusts can resist spore colonisation
- Spores can remain viable for up to 14 days, however, persistence on vegetation and control provided declines to 50% within 4 days, and 10% by 14 days
- Symptoms can take up to 8-12 days to provide full control of infected pests
- No withholding period for most agricultural situations
